Title

Quantum black holes and the singularity problem

Area

(Materials, Optics, Condensed Theory, High Energy Theory,...);

Theoretical Physics

Summary of Proposal

Black holes and singularities are believed to be unavoidable predictions of the Theory of General Relativity [1]. In this essay, we propose a study on the conditions of defining a quantum black hole and of examining whether their singularities share some features with their classical counterparts [2].

Furthermore, we suggest a study on how extensions of the underlying algebra of Quantum Mechanics allow for quantum mechanically avoiding singularities. The example the phase-space noncommutativity is indicated as a case study [3,4,5].
